

Product Feedback Analysis — Zomato (August 2026)

1. Project Overview

This project analyzes **19 recent Zomato Google Play Store reviews** to identify recurring user problems, prioritize key pain points, and recommend product improvements.

- **Project:** Zomato User Feedback Analysis
 - **Dataset:** 19 Google Play Store reviews
 - **Method:** AI-assisted user feedback analysis using Claude
 - **Actionable reviews:** 11
 - **Non-substantive/generic reviews:** 8
 - **Objective:** Convert qualitative user feedback into actionable product recommendations and measurable success metrics
-

2. User Feedback Dataset

- **Source:** Zomato reviews from the Google Play Store
- **Composition:** Mix of 1-star, 3-star, and 5-star reviews
- **Sample size:** 19 reviews
- **Purpose:** Identify both negative experiences and positive signals, then translate recurring problems into potential product improvements.

Users Represented in This Sample

The sample consists of **Zomato customers who left reviews on the Google Play Store**, including both satisfied and dissatisfied users.

Because the sample contains only 19 reviews, it **should not be considered representative of Zomato's overall customer base**. The findings are directional and intended to generate product hypotheses for further validation.

3. Key Themes

Theme	No. of Mentions	Pain Point	Suggested Feature	Priority
App technical issues	2	Installation/download problems	Improve install reliability, crash analytics, and troubleshooting	High
Order accuracy/quality	1	Wrong or damaged items and refund issues	Photo-proof at pickup and automatic refund validation	High
Payment bugs	1	COD failures	Real-time COD eligibility check before order confirmation	High
Delivery inconsistency	1	Rider-dependent delivery experience	Improve delivery monitoring and rider performance tracking	Medium
Service availability	1	Service unavailable in some locations	Improve service coverage and clearly communicate availability by location	Medium

Additional Feedback

Eight reviews contained generic positive comments such as "good," "nice," "super," or "excellent." These were retained in the dataset but excluded from actionable theme counts because they did not provide enough information to identify a specific product problem or opportunity.

4. Top 3 User Pain Points

4.1 App Technical Reliability

Problem:

Some users reported installation or download problems that can prevent them from accessing the product.

Evidence:

2 reviews mentioned app technical issues.

Why it matters:

If users cannot install or access the app, they cannot reach the ordering funnel. Technical reliability is therefore a fundamental product requirement.

4.2 Order Accuracy & Fulfillment Quality

Problem:

Users may receive incorrect or damaged items and experience friction when seeking an appropriate refund.

Evidence:

1 detailed review reported an incorrect/damaged order and a refund issue.

Why it matters:

Order accuracy directly affects customer trust. A poor fulfillment experience can reduce the likelihood of repeat orders and increase complaints.

4.3 Payment/COD Reliability

Problem:

COD failures can prevent users from completing an order.

Evidence:

1 review specifically mentioned a COD-related payment problem.

Why it matters:

Payment failures create direct checkout friction and can result in abandoned orders.

5. Recommended Product Roadmap

Priority	Initiative	What to Build
P0	Improve app technical reliability	Strengthen install reliability, crash analytics, and troubleshooting flows
P1	Improve order accuracy and refund handling	Introduce photo-proof at pickup for selected high-value/fragile orders and improve automated refund validation
P2	Improve COD payment reliability	Validate COD eligibility before order confirmation based on relevant order, location, and delivery constraints

Why This Order?

- **P0 — Technical reliability:** Users need to be able to install and access the application before any other product improvement can benefit them.
- **P1 — Order accuracy:** Incorrect or damaged orders create significant trust problems and can affect repeat usage.
- **P2 — COD reliability:** Payment failures directly affect checkout completion but appeared less frequently in this small sample.

6. Success Metrics

Feature	Primary Metric	Expected Signal
Install reliability improvements	Install completion rate	Increase in successful installs and fewer install-related complaints
Crash monitoring & fixes	Crash-free session rate	Improved application stability
Photo-proof at pickup	Order-mismatch complaints per 1,000 orders	Reduction in wrong/damaged order complaints
Automatic refund validation	Refund resolution time	Faster refunds and fewer escalations
COD eligibility check	COD checkout failure rate	Reduction in COD-related checkout failures
COD reliability improvements	COD-to-completed-order conversion	Higher percentage of successful COD orders

7. Product Brief

Users

Zomato customers who provide feedback through the Google Play Store. The sample includes both satisfied and dissatisfied users but is not representative of the entire Zomato customer base.

Top Problems

1. **App technical reliability** — installation/download problems
2. **Order accuracy and fulfillment quality** — wrong/damaged items and refund issues
3. **Payment/COD reliability** — COD failures during the ordering process

Recommended Features

1. Improve app installation reliability, crash monitoring, and troubleshooting.
2. Introduce order verification and improve automated refund handling.
3. Add real-time COD eligibility validation before order confirmation.

Success Measurement

Success would be measured using:

- Install completion rate
- Crash-free session rate
- Order-mismatch complaints per 1,000 orders
- Refund resolution time
- COD checkout failure rate
- COD-to-completed-order conversion

8. Limitations & Next Steps

This analysis is **directional rather than statistically representative** because it is based on only 19 reviews, of which 11 contained actionable feedback.

Before making significant product roadmap decisions, the findings should be validated using a larger dataset.

Recommended Next Steps

- Analyze **100+ recent reviews**, particularly 1–2 star reviews.
- Compare findings across different time periods.
- Analyze customer support and refund complaints.
- Examine checkout/payment failure data.
- Validate whether the identified pain points occur frequently enough to justify engineering investment.

This would help distinguish isolated complaints from genuinely recurring product problems.

9. Key Product Insight

The analysis suggests that the most important opportunities are not simply about adding new features. **Reliability and trust are the bigger themes.**

Users need to be able to:

Access the app → Complete payment → Receive the correct order → Resolve problems quickly when something goes wrong.

Improving these fundamental parts of the experience should be validated before investing heavily in additional functionality.

Resume Line

Conducted AI-assisted user feedback analysis on 19 Zomato Play Store reviews, identifying key pain points and proposing a prioritized product feature roadmap.
